

**IN THE UNITED STATES BANKRUPTCY COURT
FOR THE EASTERN DISTRICT OF MISSOURI
EASTERN DIVISION**

In re:

PATRIOT COAL CORPORATION, *et al.*,

Debtors.

**Case No. 12-51502 (Jointly Administered)
Chapter 11**

**STRATA MINE SERVICES, LLC'S
NOTICE OF PERFECTION OF MECHANICS' AND MATERIALMENS' LIENS**

NOTICE IS HEREBY GIVEN that before the date of filing of the Petitions in these jointly-administered cases, Strata Mine Services, LLC, a subsidiary of Strata Worldwide, LLC (“Claimant”), furnished work and materials to Patriot Coal Corporation, Eastern Associated Coal, LLC, Gateway Eagle Coal Company, LLC, and/or other affiliates or subsidiaries of Patriot Coal Corporation (the “Debtors”) for use in, *inter alia*, the erection, construction and/or improvement of real property and related facilities known as “Eastern Associated Coal, LLC – Campbells Creek 11B, 34521 Pond Fork Road, Wharton, Crook Magisterial District, Boone County, West Virginia” and more particularly described in Exhibit 1, attached hereto (the “Property”), for which Claimant has not been paid totaling \$14,719.70, exclusive of finance and other charges (the “Debt”).

NOTICE IS FURTHER GIVEN that, to secure payment of the Debt, Claimant asserts mechanics' and materialmens' liens (the “Liens”) against the Debtors' interest in the Property, including lots and tracts of land and upon the buildings, structure, and improvements thereon and proceeds, products, offspring, rents, and profits of such Property, pursuant to W. Va. Code § 38-2-1, *et seq.* (the “West Virginia Mechanics' Lien Law”).

NOTICE IS FURTHER GIVEN that Claimant recorded a Notice of Mechanics' Lien in the county or counties in which the work was performed within one hundred days of the service dates pursuant to the West Virginia Mechanics' Lien Law.

NOTICE IS FURTHER GIVEN of the perfection of the Liens in the Property, including lots and tracts of land and upon the buildings, structure, and improvements thereon and proceeds, products, offspring, rents, and profits of such Property. A true and correct copy of the Claimant's recorded Notice(s) of Mechanics Lien and claim are attached hereto as Exhibit "1."

NOTICE IS FURTHER GIVEN that Claimant has a right to assert the Liens and intends to assert and enforce the Liens. This Notice is being filed and served pursuant to 11 U.S.C. § 546(b)(2) in lieu of commencement of a suit in chancery pursuant to the West Virginia Mechanics' Lien Law.

Date: February 27, 2013

Respectfully submitted,

**ATTACHMENT 1
ENVIRONMENTAL RESOURCE INFORMATION
WHARTON NO. 4 MINE**

1.0 SUMMARY AND CONCLUSIONS

The Wharton No. 4 Mine is an existing underground mine in the Campbell Creek coal seam. It is located in Boone County in southwestern West Virginia (Figures 1 and 2). This attachment presents environmental resource information for the permit and adjacent areas. Data utilized to prepare this attachment were gathered by field sampling and reconnaissance, literature review, and contact with personnel from Eastern Associated Coal Corp. and appropriate state and federal agencies.

Terrain in the study area is rugged with steep and narrow valleys; elevations range from about 800 to 2400 feet. Rock strata exposed are on the southeast limb of a broad northeast-trending syncline with a gentle dip to the northwest. Stratigraphic units belong mainly to the Kanawha Formation (Figure 3) and are composed mainly of sandstones, siltstones, and shales with coal seams distributed throughout. Regional stratigraphic relationships and geologic structure are shown in Cross Sections A-A' (Figure 4A) and B-B' (Figure 4B). Figure 5 illustrates stratigraphy at the surface disturbed areas.

Considerable surface and underground mining has occurred in the Wharton No. 4 Mine vicinity. Figure 1 identifies representative surface mining locations for major coal seams. The Hernshaw, Campbell Creek, and Powellton coals have been mined by underground methods.

To ascertain information on groundwater hydrology in the subject area, pertinent published water quality information was obtained, a groundwater usage inventory was conducted, potential aquifers were identified, and a groundwater monitoring program was completed. Both published information and the water usage inventory (Figure A-1, Sheet A) revealed that groundwater is not used over the projected limits of mining. The closest domestic groundwater usage is within one-half mile from the projected underground mining area, but not in a downdip direction. Water wells in proximity to the permit area (surface

disturbed area) are in aquifers below the Campbell Creek Coal and have not been significantly affected by past mining operations.

Below the Campbell Creek Coal, a shale or underclay up to ten feet thick is often present which restricts hydraulic communication with lower aquifers. Based on this and the good quality of water generated during mining, no operational groundwater monitoring is planned other than at existing National Pollutant Discharge Elimination System (NPDES) locations.

Discharges from the Wharton No. 4 Mine flow into Pond Fork and Jarrell Branch in the Kanawha River drainage basin. Surface water information in the subject area was obtained from published sources and a baseline monitoring program was conducted for this investigation.

Published data provide an indication that local stream water quality is not significantly different now than it was at least six or seven years ago. Baseline monitoring sample points for this study are shown in Figure 1. Appendix C contains all surface water baseline data.

Surface water information collected during the baseline monitoring period shows that water quality within the watershed containing existing surface disturbed areas for proposed operations at the Wharton No. 4 Mine has been affected by past mining operations. Discharges from areas of current operations contribute only a small percentage of the total flow to their respective receiving streams. Neither surface water quality nor quantity should be significantly affected by proposed operations.

Soils in the study area were evaluated in consideration of topsoil requirements for reclamation. It was determined that by utilization of appropriate soil handling and reclamation techniques, sufficient soil is present in the permit and adjacent area for adequate reclamation of surface disturbed areas around the facility.

Vegetation and fish and wildlife were qualitatively characterized in the study area. Vegetation in the subject area is dominated by deciduous forest with residential and agricultural plantings confined largely to valley bottoms and

some early successional communities in areas of land disturbances and subsequent abandonment. Terrestrial wildlife is characterized by species indigenous to deciduous forest associations. Because of prior environmental stresses from mining activities, the aquatic ecosystem in the area is characterized by poorly diversified and low-density benthic communities and fish populations. No federally or state-listed rare or endangered species have been recorded in the immediate study area.

To facilitate determination of appropriate postmining land use, premining and existing land use, land capability and productivity, and occurrence of prime farmland were evaluated. Premining land use in the area was largely forestland with limited residential use along larger stream valley bottoms. Prior to existing mining-related operations, considerable surface and underground coal mining occurred, leaving characteristic highwalls and benches.

Presently, forestlands occupy approximately 83% of the land in Boone County. No residential land use currently exists in the permit area but it does occur in nearby areas; residential use occupies only 1% of the land area in Boone County. Active mining operations presently represent about 10% of land use in the county.

Land capability and productivity in the Wharton No. 4 Mine area are severely limited by steep topography. This also limits the potential for residential, commercial, or industrial development although limited residential and agricultural land utilization in larger valley bottoms is possible. No prime farmland was identified on or adjacent to existing or proposed surface disturbances within the permit area.

2.0 STUDY AREA DESCRIPTION

2.1 DESCRIPTION OF PERMIT AND ADJACENT AREA

The Wharton No. 4 Mine is an active underground mine in the Campbell Creek coal seam. It is located in southwestern West Virginia in Boone County (Figure 1). For descriptive purposes, Figure 1 identifies the permit area consisting of surface disturbed areas where mining-related facilities are located and adjacent areas including the five-year underground mining projections. Surface disturbed areas (e.g., portals, fans, access roads) are shown at a larger scale

(1" = 500') in Figure 2 (Pre-Plan and Drainage Map). This larger-scale drawing is indexed in Figure 1 to facilitate the location of specific areas.

Adjacent areas are considered as both surface and underground areas occurring immediately next to permit areas. The size of adjacent areas is large enough to allow evaluation of the consequences of mining on local and/or regional environmental resources. Figure 1 presents elements of the permit and adjacent area considered including baseline groundwater and surface water sample locations, geologic cross section locations, and archaeological sites.

Terrain at the mine site and adjacent area is typical of the Appalachian Plateaus Physiographic Province, with a dendritic drainage pattern which has incised steep, narrow valleys. Elevations in the study area range from about 800 to 2400 feet. Topographic maps covering parts of the study area are the following U.S. Geological Survey (USGS) 7.5-minute series: Wharton, Whitesville, Pilot Knob, and Lorado.

Although the Wharton No. 4 Mine extracts coal from the Campbell Creek seam, other coals have been mined by both surface and underground methods in the general study area. This will be discussed further in Section 3.2, Geology of the Permit Area, and Section 7.2, Previous Mining in the Permit Area.

2.2 CULTURAL, HISTORICAL, AND ARCHAEOLOGICAL RESOURCES

Several archaeological sites have been recorded in the general study area. The approximate locations of these sites are shown in Figure 1. These sites have not been professionally evaluated and, therefore, the locations may not be completely accurate. Contact with the West Virginia Department of Culture and History indicated that these sites should not be impacted by the proposed mining activity (Wise, 1981). This is based on the prior existence of most surface disturbances due to past and present mining operations, the small surface disturbed acreage involved, and archaeological sites not being in immediate proximity to surface disturbances. No unique cultural or historical resources were found in the area.
